

Protokol vymeny klucov Diffie-Hellman Pseudokod

Algorithm 1 Bezpecna vymena klucov: Inicializacia relacie s docasnymi klucmi

```
1: function INITIALIZE_SECURE_SESSION(master_key, is_initiator)
2:   Vstup: master_key (32B tajomstvo), is_initiator (boolean)
3:   Vystup: session_key (32B) alebo kod chyby
4:   Obe strany:
5:   ephemeral_secret  $\leftarrow$  generate_random_bytes(32)  $\triangleright$  Vygenerovanie tajneho X25519 kluca
6:   ephemeral_public  $\leftarrow$  crypto_x25519_public_key(ephemeral_secret)  $\triangleright$  Odvodenie verejneho kluca
7:   if is_initiator then  $\triangleright$  Strana klienta
8:     Cakat na verejny kluc servera
9:     peer_public  $\leftarrow$  recv_all(socket, 32)
10:    Poslat verejny kluc klienta
11:    send_all(socket, ephemeral_public, 32)
12:    session_nonce  $\leftarrow$  generate_random_bytes(24)  $\triangleright$  Vygenerovanie nonce pre relaciu
13:    send_all(socket, session_nonce, 24)  $\triangleright$  Poslanie nonce serveru
14:  else  $\triangleright$  Strana servera
15:    Poslat verejny kluc servera
16:    send_all(socket, ephemeral_public, 32)
17:    Cakat na verejny kluc klienta
18:    peer_public  $\leftarrow$  recv_all(socket, 32)
19:    Cakat na nonce relacie
20:    session_nonce  $\leftarrow$  recv_all(socket, 24)
21:  end if
22:  Obe strany:
23:  shared_secret  $\leftarrow$  crypto_x25519(ephemeral_secret, peer_public)  $\triangleright$  Vypocitanie DH tajomstva
24:  session_key  $\leftarrow$  setup_session(master_key, shared_secret, session_nonce)
25:  secure_wipe(ephemeral_secret)  $\triangleright$  Bezpecne vymazanie tajneho kluca
26:  secure_wipe(shared_secret)  $\triangleright$  Bezpecne vymazanie zdielaneho tajomstva
27:  return session_key
28: end function
```

Algorithm 2 Odvodzovanie klucov relacie

```
1: function SETUP_SESSION(master_key, shared_key, session_nonce)
2:   Vstup: master_key (32B), shared_key (32B z X25519), session_nonce (24B)
3:   Vystup: session_key (32B)
4:   ctx  $\leftarrow$  crypto_blake2b_init(32)           ▷ Inicializacia BLAKE2b kontextu s vystupom 32B
5:   crypto_blake2b_update(ctx, master_key, 32)      ▷ Pridanie hlavneho kluca do hashu
6:   crypto_blake2b_update(ctx, shared_key, 32)      ▷ Pridanie zdielaneho tajomstva do hashu
7:   crypto_blake2b_update(ctx, session_nonce, 24)  ▷ Pridanie nonce do hashu
8:   session_key  $\leftarrow$  crypto_blake2b_final(ctx)  ▷ Dokoncenie hashu do kluca relacie
9:   crypto_wipe(ctx)                               ▷ Bezpecne vymazanie hash kontextu
10:  return session_key
11: end function
```

Algorithm 3 Protokol rotacie a validacie klucov

```
1: function ROTATE_SESSION_KEY(current_key, block_count)
2:   Vstup: current_key (32B), block_count (pocitadlo)
3:   Vystup: new_key (32B) alebo kod chyby
4:   if block_count mod KEY_ROTATION_BLOCKS = 0 then                                ▷ Cas na rotáciu kľuca
5:     Strana klienta:
6:     send_chunk_size(socket, KEY_ROTATION_MARKER)                                ▷ Signal rotácie kľuca
7:     Čakat na potvrdenie servera
8:     rotation_nonce ← generate_random_bytes(24)                                ▷ Vygenerovanie nonce pre rotáciu
9:     send_all(socket, rotation_nonce, 24)                                        ▷ Poslanie nonce serveru
10:    Obe strany:
11:    previous_key ← copy(current_key)                                            ▷ Uloženie aktuálneho kľuca
12:    current_key ← rotate_key(previous_key, rotation_nonce)                    ▷ Vygenerovanie nového kľuca
13:    Strana klienta:
14:    send_chunk_size(socket, KEY_ROTATION_VALIDATE)                            ▷ Signal validácie
15:    validation ← generate_key_validation(current_key)                        ▷ Vytvorenie validacieho kodu
16:    send_all(socket, validation, 16)                                           ▷ Poslanie validacieho kodu
17:    Strana servera:
18:    client_validation ← recv_all(socket, 16)                                ▷ Prijatie validacieho kodu
19:    our_validation ← generate_key_validation(current_key)
20:    if client_validation ≠ our_validation then
21:      return ERROR_KEY_VALIDATION_FAILED
22:    end if
23:    send_chunk_size(socket, KEY_ROTATION_READY)                                ▷ Signal pripravenosti
24:    secure_wipe(previous_key)                                                  ▷ Bezpečne vymazanie starého kľuca
25:  end if
26:  return current_key
27: end function
28: function GENERATE_KEY_VALIDATION(key)
29:   Vstup: key (32B)
30:   Vystup: validation (16B)
31:   validation ← crypto_blake2b(key, "VALIDATION", 16)
32:   return validation
33: end function
34: function ROTATE_KEY(previous_key, rotation_nonce)
35:   Vstup: previous_key (32B), rotation_nonce (24B)
36:   Vystup: new_key (32B)
37:   new_key ← crypto_blake2b(previous_key || rotation_nonce || "ROTATE", 32)
38:   return new_key
39: end function
```
